

# You're lost in a sea of data.

Navigating massive spreadsheets means constantly losing your place between rows and columns.

# This isn't just an inconvenience. It's a drag on your work.

## It leads to costly errors.

Misreading data from the wrong row is a silent killer of accuracy.

## It wastes valuable time.

Constantly re-orienting yourself breaks your flow and slows you down.

## It causes unnecessary eye strain.

Your eyes work overtime just to track your position.

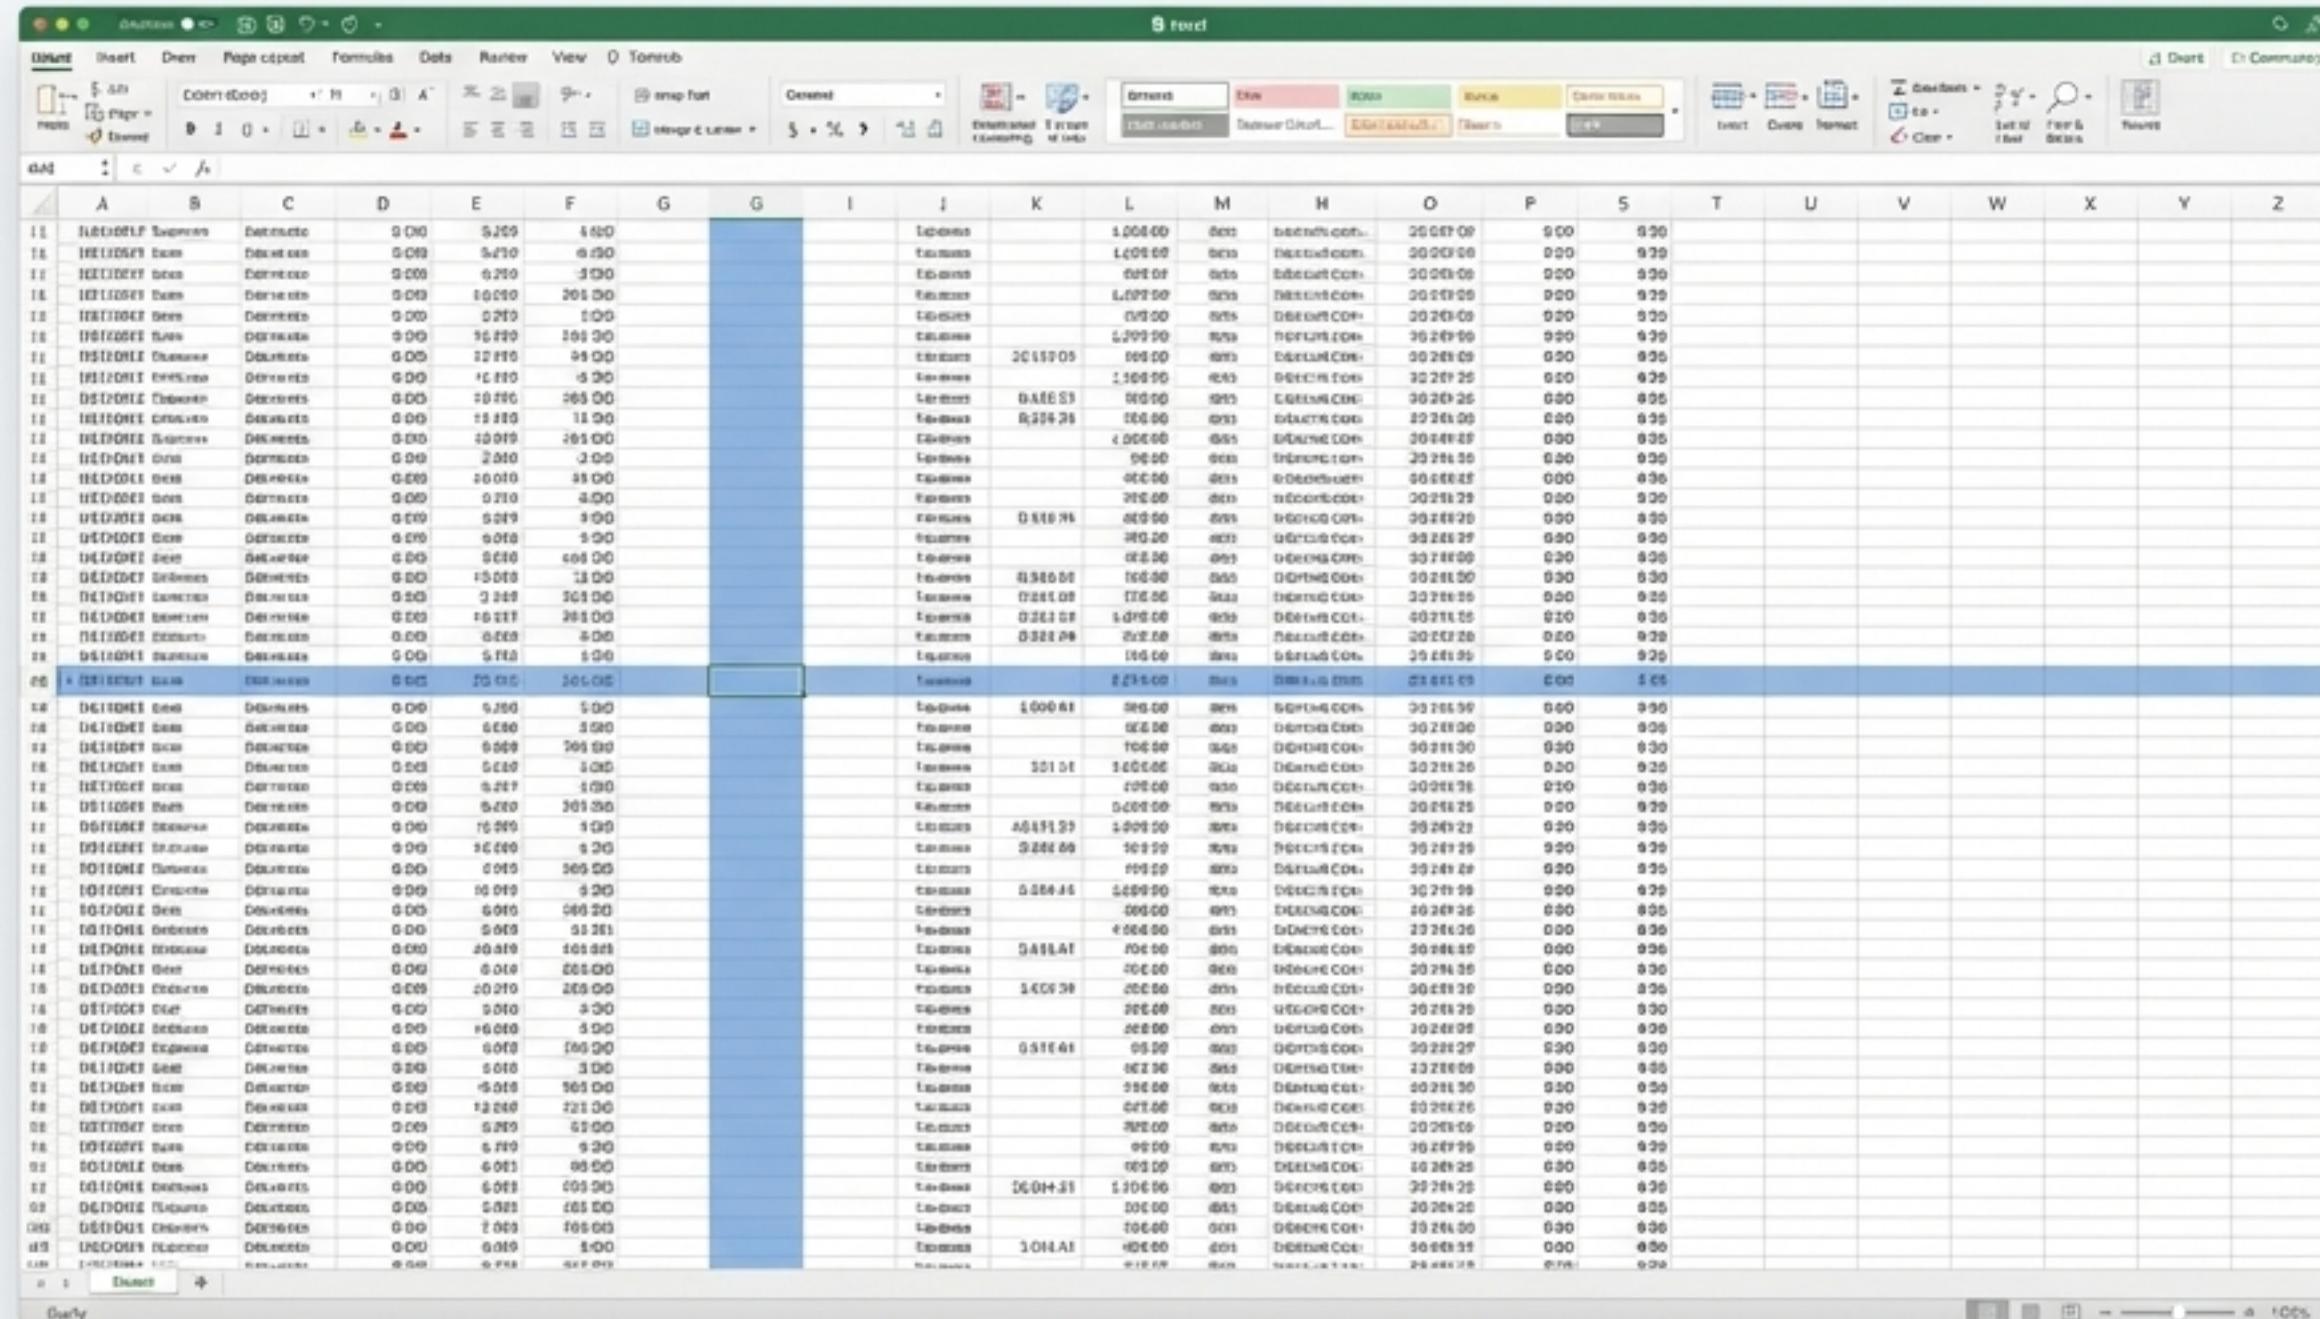

**Your eyes are working overtime just to stay oriented.**

# There is a simpler way to maintain absolute focus.

Introducing a simple Excel add-in that highlights your active row and column, creating a “focus cell” that moves with you.

# Instantly see where you are, without a second thought.

The 'plus\_.xlam' add-in keeps you locked on the active cell, no matter where you navigate.

# Three steps to perfect focus.

## 1. Download

Get the add-in file.

## 2. Install

Add it to Excel.

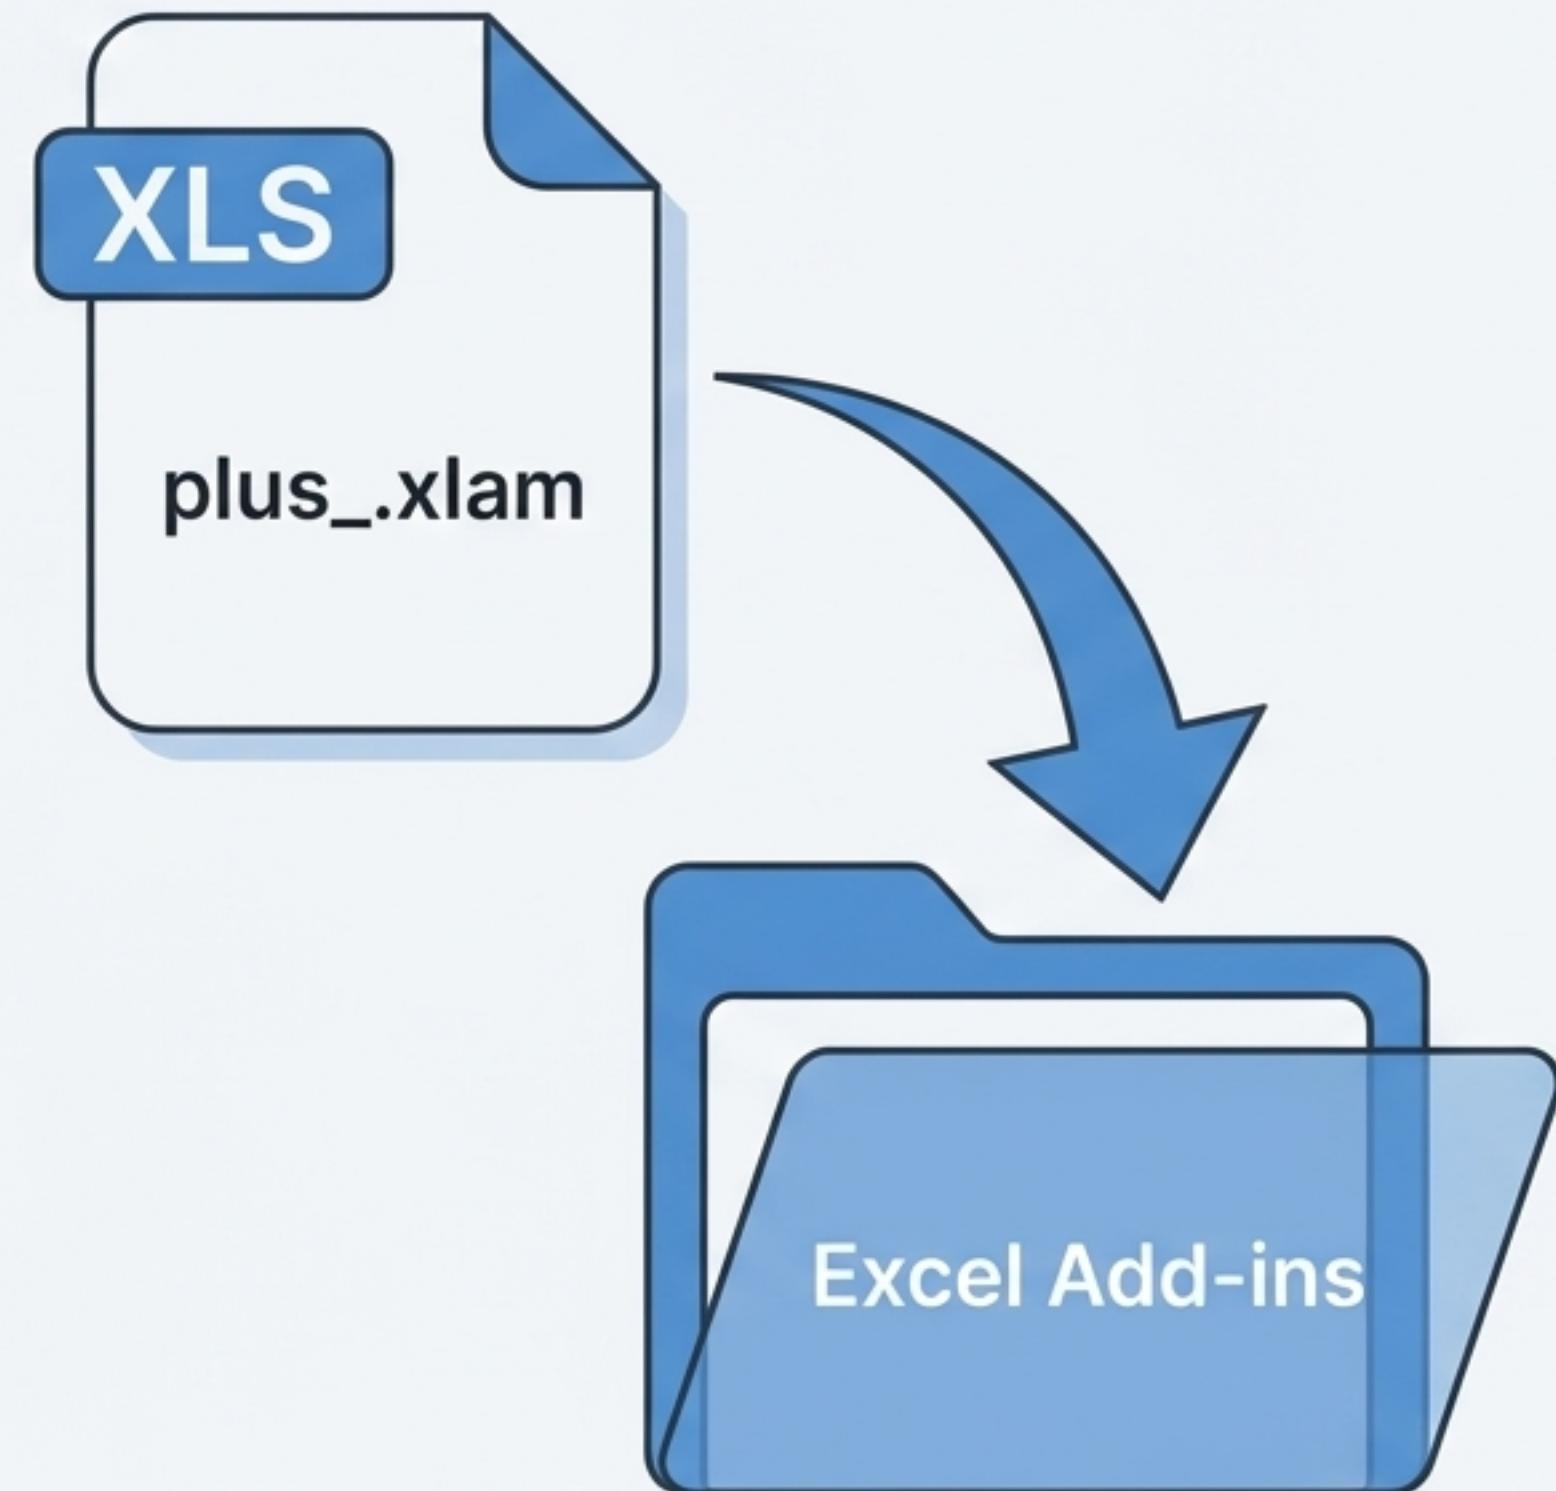

## 3. Activate

Use the shortcut.

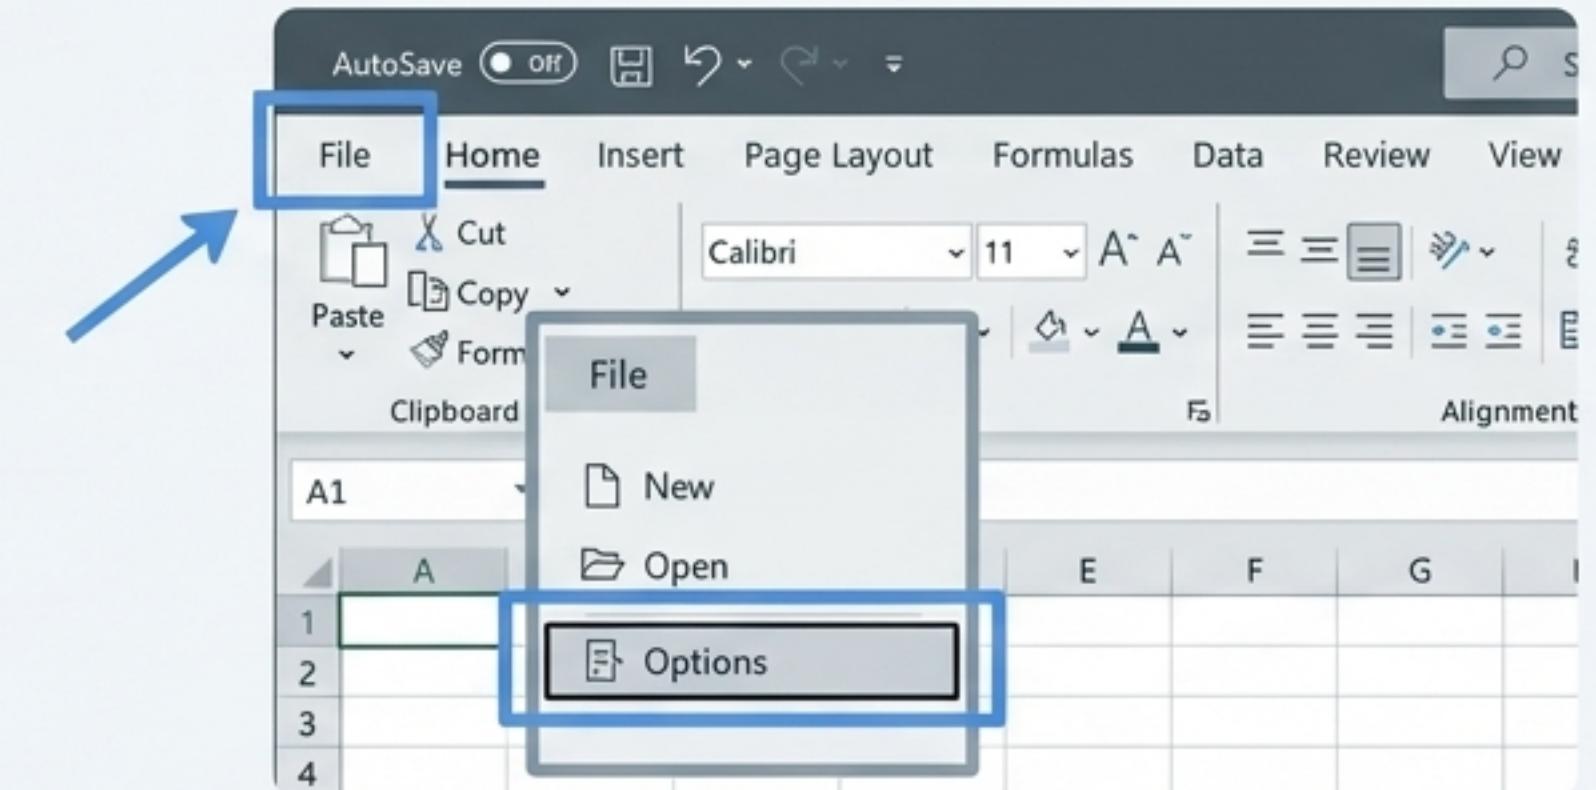

We'll walk you through the one-time setup process step-by-step.

# Step 1: Download and Save the Add-in File

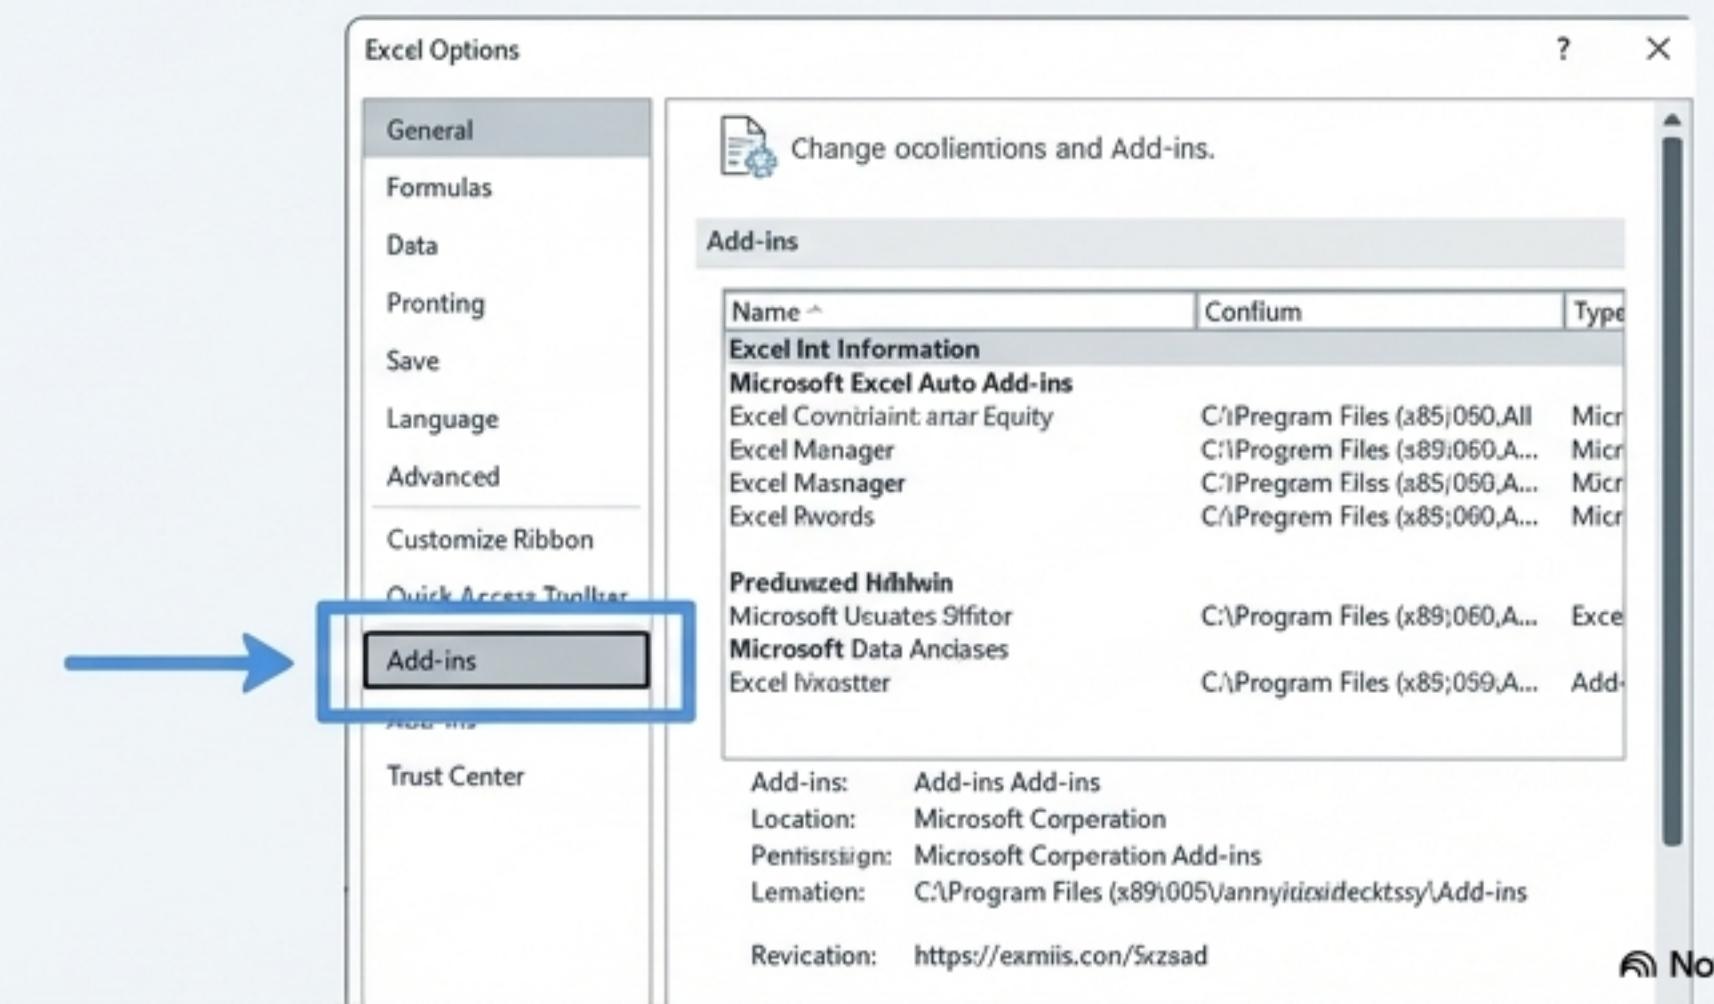

First, download the `plus\_.xlam` file. Save it to a permanent location on your device where it won't be accidentally moved or deleted (e.g., a dedicated 'Excel Add-ins' folder in your Documents).

# Step 2: Navigate to the Add-ins Manager

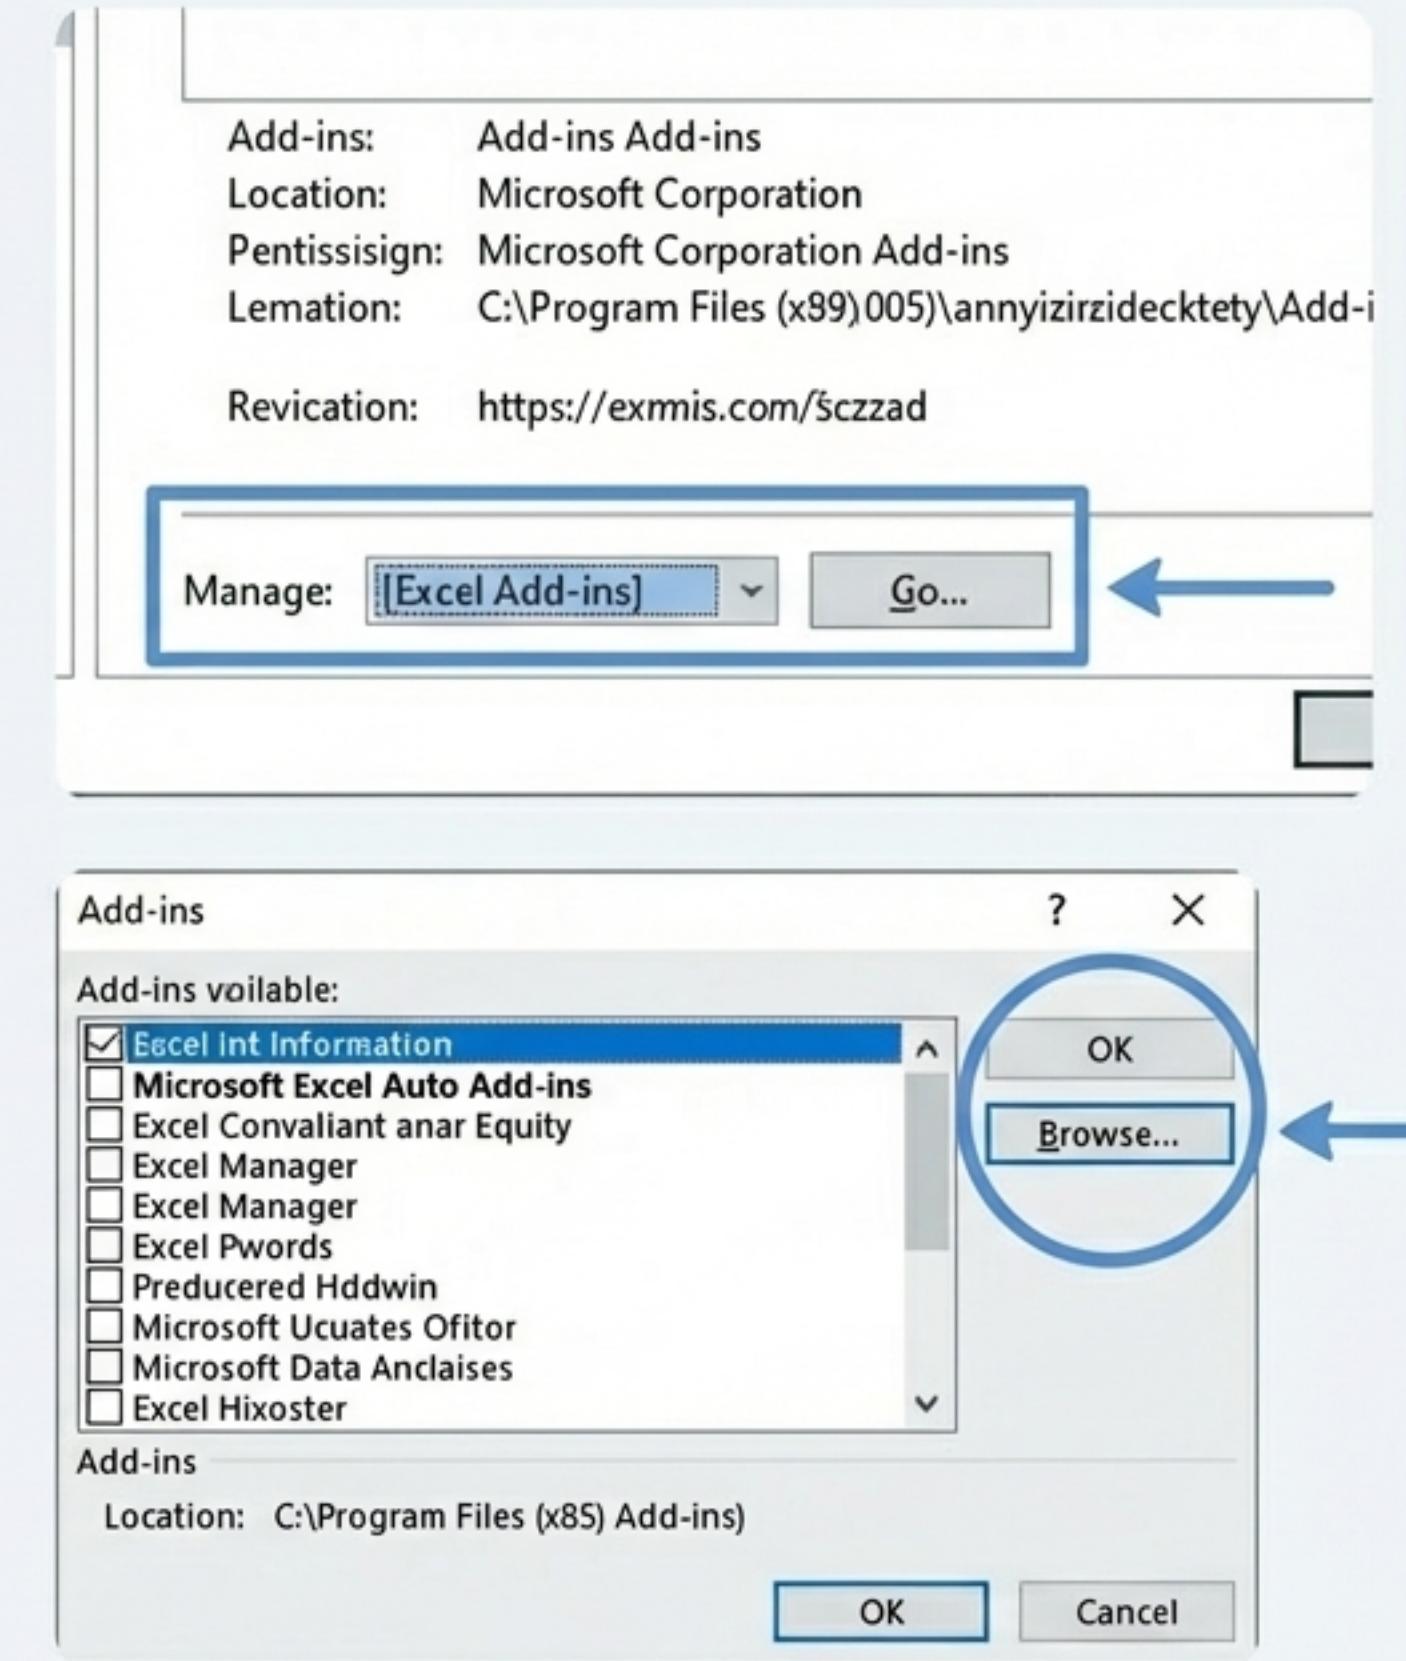

- In any open Excel file, go to `File > Options`.
- In the Excel Options window, select `Add-ins` from the left-hand menu.

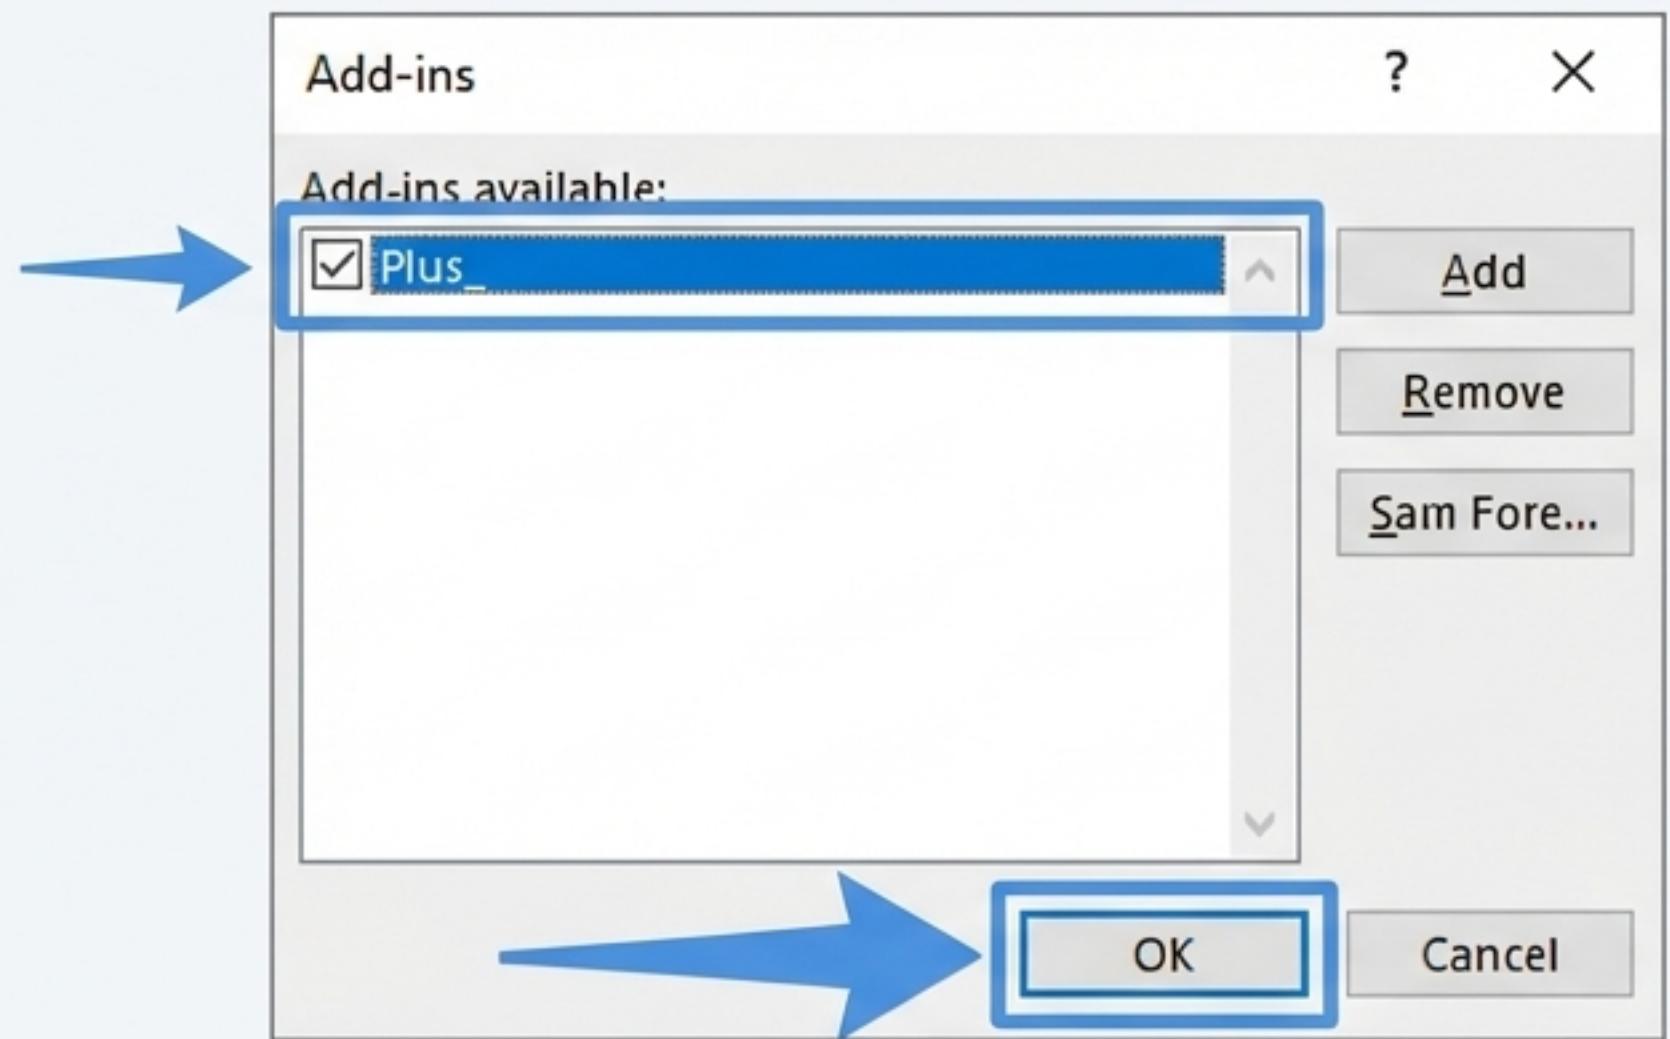

# Step 3: Browse for Your Saved File

- At the bottom, ensure `Excel Add-ins` is selected in the `Manage` dropdown, then click `Go...` .
- In the new dialog box, click `Browse...` to open the file explorer.

## Step 4: Add and Enable the Feature

Navigate to and select the `plus\_.xlam` file you saved. Ensure the new add-in is checked in the list, then click `OK`. The feature is now installed and ready to use.

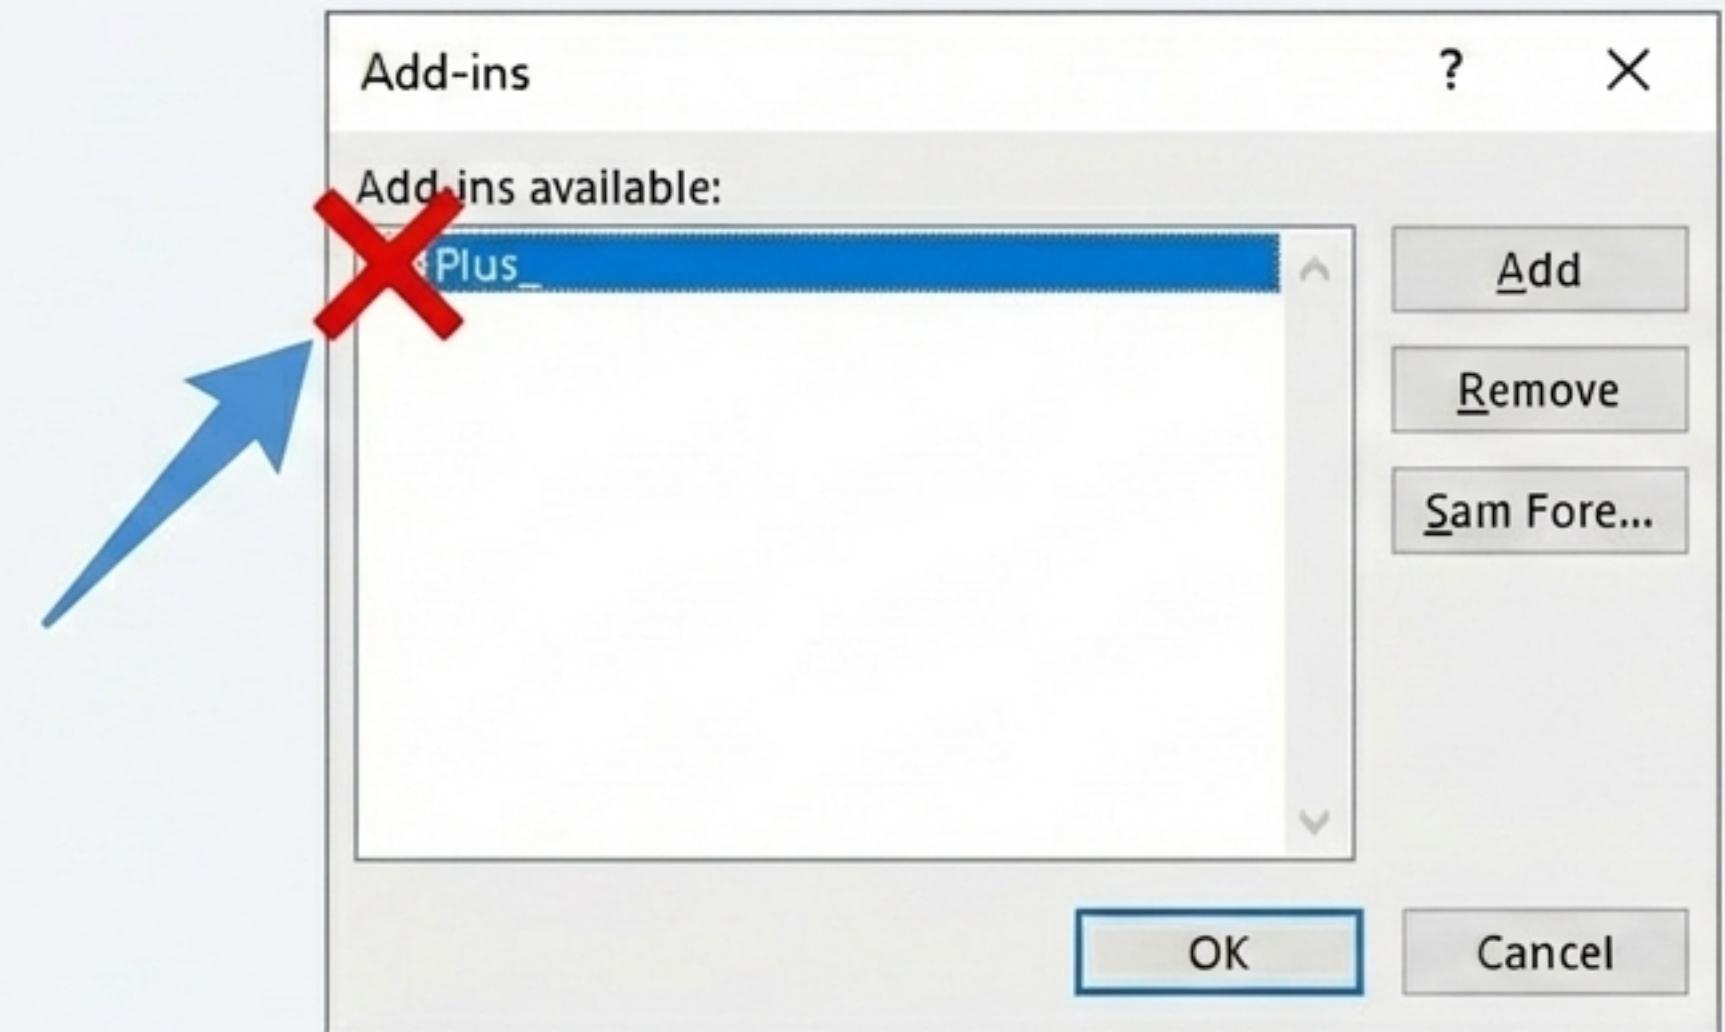

# Activate and Deactivate with a Simple Shortcut

- Press `Control + J` to turn the focus highlighting ON.
- Click on any cell to see it in action.
- Press `Control + J` again to turn it OFF.

# Need to disable it? It's just as easy.

If you no longer want the feature, simply return to `Options → Add-ins → Go...'. Uncheck the box next to the add-in. It will be disabled permanently until you choose to re-enable it.

## **Important Note: Potential Shortcut Conflicts**

If the add-in doesn't work, it's likely because another function or macro is already assigned to 'Control + J'. This add-in will not function unless you reassign or remove that pre-existing shortcut.

# The Focus Cell Cheat Sheet

## THE GOAL

Instantly highlight the active row and column to eliminate confusion in large datasets.

## TROUBLESHOOTING

Not working? Check for an existing 'Control + J' shortcut conflict.

## THE SHORTCUT (On/Off Toggle)

## MANAGE

Enable or disable the add-in anytime via 'Options → Add-ins → Go...'
